

JOYCE
GROUP LTD

TO WHOM IT MAY CONCERN

Mr Chris Withers of Renaissance Tiling recently demonstrated a prototype model of a shower mixing valve protective system which he has invented.

It is called a “Wet Wall Caddy” and protects any damage which would occur behind shower linings should the mixing valve leak.

In our experience leakage from mixing valves occur regularly, but shower users and owners of buildings are often unaware this is occurring until consequential damage to wall framing and linings is at such an advanced stage, that damage is often extensive and costly.

Mr Withers protective system would obviate this risk.

Our team of building consultants, architects, building surveyors, clerks of works, project managers and architects will specify this product as soon as it becomes available and will also recommend it to developers and our clients.

The system is simple and effective and we would recommend it be used in conjunction with all shower-mixing valves.
