Dear Chris

After having examined your shower valve and wing back sealing 'caddy' device I believe you have a very good invention concept in this product. It would overcome the significant behind the wall damage that can arise if a leakage ever develops with the shower mixer valve or wing back resulting in damage to the wall and flooring structures.

Your caddy design would force any such leakage water to egress through the front of the shower wall lining and into the shower box where it can harmlessly drain away.

It would also immediately identify the fact that there was a leakage in the system requiring repair, something not immediately noticeable with behind the wall leakages in conventional installations.

I wish you the best of success with its development.

Regards

Chris Preston
